### **Abstract**

A geological fieldwork was carried out in and around Malvan, Sindhudurg District in Maharashtra, India as a part of TYBSc coursework through St. Xavier's College-autonomous, Mumbai. The area of study included several locations within the districts including Malvan, Kankavli, Tarkarli, Devli, Ozhar, Talashil, Sarjekot, Ghumade, and Ramgad. The fieldwork involved a detailed study of the Stratigraphy of the rocks belonging to Dharwar Craton. Several exercises in sedimentology and structural geology were performed to gain a deeper understanding of the rock types, along with observing sedimentary structures, geomorphological structures and learning about several surveying techniques (including plane-table survey and total station theodolite) amongst many other activities. The following field-report is based on the study of stations visited during the field tour along with data obtained from various research papers by geologists who carried out detailed study in the region, and several reference books.
